SECTION 7

**- REGULATION FD**

Item 7.01 Regulation FD Disclosure

On January 23, 2008, Nord Resources Corporation ("Nord") issued a news release announcing the results for the first phase of vertical reverse circulation drill holes completed at the Johnson Camp Mine. Nord also announced that it has elected not to proceed further with its option to acquire the Mimbres exploration property in New Mexico, which is not material to Nord's overall operations.

Drilling Results

The twenty-five drill holes are located adjacent to and to the south of the Burro Pit and in the Copper Chief deposit area on the Johnson Camp property. The drill results, when combined with a previous drill hole, S-13, indicate the continuation of copper mineralization from the current south edge of the Burro Pit approximately 1,000 feet further to the south. The drill results also indicate that the copper mineralization in this area is hosted in the same rock units as at the Burro Pit. The drilling at Copper Chief increases the drill hole density within the current planned pit in the north area of the deposit and also expands copper mineralization to the northwest and southeast of the planned pit boundaries. The news release, furnished as an exhibit hereto, contains a table disclosing certain quantitative data about

the drilling results and assay results, and also includes maps showing the drill hole locations.

Nord has previously announced proven and probable reserves at its Johnson Camp Mine of 73.4 million tons of ore, consisting of 55.0 million tons proven and 18.4 million tons probable, at an average total copper grade of 0.335% total copper based on a copper price of \$1.50 per pound, a stripping ratio of 0.66 to 1 and an internal cut-off grade of 0.06% total copper, as estimated in the Johnson Camp Mine Project, Feasibility Study, Cochise County, Arizona, Technical Report dated September 28, 2007, prepared by Bikerman Engineering & Technology Associates, Inc., filed on SEDAR at [www.sedar.com](http://www.sedar.com).

The drilling results indicate the extension of copper mineralization for approximately 1,000 feet to the south of the Burro Pit. In addition, the new drilling both in and around the Copper Chief deposit has increased the previously known area of copper mineralization. The drill results will be incorporated into the Burro and Copper Chief block models in the very near future. Nord intends to commence a second phase of exploration drilling at Johnson Camp later this year.

All of the sample preparation and assays in the news release have been performed by Skyline Labs, Tucson, Arizona, a laboratory independent to Nord utilizing industry standard analytical methods. A sample quality assurance/quality check program is routinely followed which calls for the regular insertion of independent standards, blanks and duplicate samples. The results of this program have been satisfactory.

The drilling and assaying program are being performed under the direction of consulting geologist, Thornwell Rogers..

The information in the news release was reviewed by John Cook, P.E., a Director of the Company and a Qualified Person under National Instrument 43-101.
